PREFACE

Information is an important pillar of development initiatives. Good information is a prerequisite for systematic planning, implementation and monitoring of development activities. In recognition of this fact, the Government of Botswana conducts national censuses once every ten years covering a wide array of socio-economic variables.

To enhance the use of data, it becomes necessary to present and analyse census data based on the identification of key indicators that are useful. It is in pursuit of the above objective that the Central Statistics Office (CSO) with the support of UNICEF undertook the compilation of disaggregated data by districts and villages. This report is an outcome of that exercise.

The availability of information on key indicators disaggregated by district and village is expected to strengthen the process of decentralised planning and monitoring of development activities. Besides the public sector, the database will support the efforts of a large spectrum of non-governmental organisations that contribute to Botswana's development. In this respect, the disaggregated database is of particular relevance as districts will now be able to identify their priorities and needs in their development planning process.

For each of the ten districts and their subdistricts, data on key indicators are also disaggregated by gender where possible. The information generated is presented in three parts: a national report containing district averages, reports for each district and sub-district containing disaggregated information by villages, and an atlas depicting interdistrict disparities.

Many people have contributed to the preparation of these database reports. Mr Samuel Kimani worked as a consultant to present the disaggregated data and compile the reports under the guidance of Ms Elizabeth Mukamaambo (CSO), Dr Oluwole Adegboyega (CSO), Mrs Gwen Lesetedi (CSO), Mrs Grace Mphetolang (CSO), Dr Isiye Ndombi (UNICEF) and Dr Krishna Belbase (UNICEF). Ms Pearl Matome (UNICEF) assisted in the final editing and compilation of the report.

We would also like to express sincere acknowledgement and appreciation to the CSO staff who undertook 1991 census and to the household members who were so cooperative in providing information needed for the census.

Guest M. Charumbira
Government Statistician

List of 1991 census disaggregated database reports

- Vol.1.0 Selected demographic and socio-economic indicators (district summary data)
- Vol.2.1 Selected statistics for villages and localities in Southern district (Ngwaketse and Barolong subdistricts)
- Vol.2.2 Selected statistics for villages and localities in South East district
- Vol.2.3 Selected statistics for villages and localities in Kweneng district (Kweneng East and Kweneng West subdistricts)
- Vol.2.4 Selected statistics for villages and localities in Kgatleng district
- Vol.2.5 Selected statistics for villages and localities in Central district (Central Serowe/Palapye, Central Mahalapye, Central Bobonong, Central Boteti and Central Tutume subdistricts)
- Vol.2.6 Selected statistics for villages and localities in North East district
- Vol.2.7 Selected statistics for villages and localities in Ngamiland district (Ngamiland South and Ngamiland North subdistricts)
- Vol.2.8 Selected statistics for villages and localities in Chobe district
- Vol.2.9 Selected statistics for villages and localities in Ghanzi district
- Vol.2.10 Selected statistics for villages and localities in Kgalagadi district (Kgalagadi South and Kgalagadi North subdistricts)

Source: 1991 Population and Housing Census

²This refers to the number of deaths that would occur to live births before attaining exact age 1 in a life table with a radix of 1000. It is therefore expressed per 1000 live births. These were computed using QFIVE a United Nations computer software for mortality estimation.

³This refers to total reported births annualised by a factor of 1.123 and weighted by averages of P/F ratios of age-groups 20-24 and 25-30 using FERTIL a United Nations computer program for fertility estimation. Hence the difference between the estimates and the reported births.

MATERNAL MORTALITY RATES BY DISTRICTS

Table 5

| DISTRICTS | Female Deaths(15-49 age-group) | Estimated number of Maternal deaths | Total births | Estimated Maternal mortality rate (Per 100,000 Live Births) |
|------------------|--------------------------------|-------------------------------------|--------------|---|
| TOTAL | 1524 | 168 | 51579 | 326 |
| Urban | 299 | 33 | 12963 | 254 |
| Rural | 1225 | 135 | 38826 | 348 |

| Kgatleng | 55 | 6 | 1899 | 316 |
| C/Serowe/Palapye | 157 | 17 | 4535 | 375 |
| C/Mahalapye | 99 | 11 | 3340 | 329 |
| C/Bobonong | 55 | 6 | 1976 | 304 |
| C/Boteti | 24 | 3 | 1549 | 194 |
| C/Tutume | 112 | 12 | 3697 | 324 |
| North East | 38 | 4 | 1344 | 298 |
| Ngamiland South | 137 | 15 | 2479 | 601 |
| Ngamiland North | 78 | 9 | 1725 | 522 |
| Chobe | 38 | 4 | 590 | 678 |
| Ghanzi | 45 | 5 | 859 | 582 |
| Kgalagadi South | 20 | 2 | 682 | 289 |
| Kgalagadi North | 6 | .7 | 373 | 188 |

*Due to absence of concrete data on maternal mortality, these figures have been extrapolated from female deaths (1991 pop.census); the assumption that 11% of all female deaths are due to maternal related causes (1991 medical statistics for inpatient data) and the total births in the year preceding the census adjusted by weighting the averages of P/F ratios of age-groups 20-24 and 25-30. The health statistics report of 1990/91 gives the number of maternal deaths of women between age 15-49 for 1990 as 42. If this figure, 42, is converted into percentage of the female deaths of that age-group, then 14.5% of the institutional deaths of females aged 15-49 would be due to maternal causes. If the same is done for 1991 institutional deaths, the proportion of maternal deaths is 7.5%. To get a realistic adjustment factor, both the 1990 and 1991 maternal and female deaths are averaged to arrive at a factor of .11. Hence: MATERNAL MORTALITY RATE=MATERNAL DEATHS /TOTAL BIRTHS x 100,000. See annex 1 for detailed explanation.

Source: Computed from 1991 Population and Housing Census and medical statistics for inpatient data.

EXPECTATION OF LIFE AT BIRTH BY DISTRICTS

Table 6

| District | Life expectancy at Birth (Model West ⁴) |
|------------------------|---|
| Gaborone | 69.3 |
| Francistown | 68.3 |
| Lobatse | 66.7 |
| Selibe Phikwe | 68.8 |
| Orapa | 67.7 |
| Jwaneng | 66.0 |
| Sowa Town | 63.6 |
| Ngwaketse | 63.7 |
| Barolong | 68.2 |
| South East | 62.3 |
| Kweneng East | 64.5 |
| Kweneng West | 57.3 |
| Kgatleng | 67.3 |
| Central Serowe Palapye | 65.2 |
| Central Mahalapye | 64.3 |
| Central Bobonong | 64.4 |
| Central Boteti | 65.0 |
| Central Tutume | 65.4 |
| North East | 68.5 |
| Ngamiland South | 62.9 |
| Ngamiland North | 55.3 |
| Chobe | 61.9 |
| Ghanzi | 60.7 |
| Kgalagadi South | 63.0 |
| Kgalagadi North | 54.8 |
| Total | 65.2 |

⁴Due to the smallness of the base population, the indicator derived might be inconsistent with the expected mortality patterns in some districts. This accounts for the rather high life expectancy in these districts. The indicators however serve to provide estimates of variations in human wellbeing across districts.

| Ghanzi | 1338 | 300 | 25 |
| Kgalagadi South | 1220 | 205 | 18 |
| Kgalagadi North | 567 | 82 | 16 |

Source: 1991 Population and Housing Census

⁵ A factor of 0.937 was used to estimate the number of pregnancies since only the national totals were available.

⁶ These were indirectly derived by using women of age-group 15-19 who have had children and adjusting with a factor of 1.1 for pregnancy terminations; the assumption being that 10 to 15% of them fail due to spontaneous abortion.

CHILD MODERATE MALNUTRITION PREVALENCE BY DISTRICTS

⁷ These figures may differ from those of Ministry of Education due difference in the reporting periods. While Ministry of Education data is collected in January, Census data is collected in September, a difference of 8 months. During This period some children will have graduated to different age groups while others might have dropped out.

ANNEX 1

TECHNICAL NOTE AND METHODOLOGY

The key indicators selected in this report are defined below. The methods used in the derivation of demographic variables are described and adequate footnoting has been done where needed.

Access to safe potable water: Access to safe potable water is shown using access by piped water, either piped indoors, own yard or by standpipe. There are however large numbers of households with access by borehole, wells and springs particularly in the rural areas.

Access to toilet facilities: Access to toilet facilities is used as proxy to sanitary services. There are various types of access. These are, access by private flush, pit, neighbours pit, communal flush or pit, movable and others.

Crude birth rate: This refers to number of births in a population during a specified period divided by the number of person-years lived by the population during the same period. It is frequently expressed as births per 1000 population. The crude birth rate for a single year is usually calculated as the number of births during the year divided by the mid-year population.

De facto population: This refers to population enumerated on the basis of those present at a particular time, including temporary visitors and excluding residents temporarily absent. This is differentiated from **De jure population** which refers to population enumerated on the basis of normal residence, excluding temporary visitors and including residents temporarily absent. The 1991 Botswana population and housing census population figures refer to de facto population.

Disabilities: Disabilities are by types of disability which are categorised as inability to use one or more legs, inability to use arms, speech defects, hearing defects, mental retardation, blindness and seeing defects. The number of the disabled included those in institutions and absentees.

Education attainment: Attainment in formal education is shown using age-band 15-49. Although the population used is not a cohort, the indicator derived reveals the different levels of education attained by the particular age-band population at the time of enumeration.

Education enrolment: The age-band 7-13 is used in showing the level of enrolment into formal education. This particular age band carries the school going children. Population in age-group 7-13 is expected to be in primary school.

Heads of households: Headship here refers to defacto head of household during the enumeration period.

Heads of households with cash earning member(s): This shows the number and percent of households headed by males and females with at least one or more of the members earning cash. Although the census was defacto and therefore the figures reflect defacto household status, the proportions presented reveal a wide disparity between male headed households and female headed households.

Infant mortality rate: This is defined as number of deaths of children under one year of age occurring in the same year. It is also used to mean the number of deaths that would occur under one year of age in a life table¹ with a radix² of 1000. It is therefore commonly expressed per 1000 live births.

Labour force participation: Labour force participation is defined by the International Labour Organization as

¹Refers to listing of survivors at different ages in a hypothetical cohort subject from birth to a particular set of observed age specific mortality rates in a given population during a particular period. The life table also constructs other demographic indicators showing different experiences of the cohort.

²This denotes the hypothetical birth cohort of a life table. Common values are 11,000 and 100,000.

the number of population between age 15 and 64 years who are employees earning cash or kind, self employed and those seeking work. Out of the total respective gender population the participation by gender, those in the labour force are shown as percentages. Certain groups of people are not in the labour force owing to various reasons. For instance people in educational, correction, medical institutions and doing housework are not in the labour force.

Life expectancy: This refers to the average number of years that a member of a cohort of births would be expected to live if the cohort were subject to the mortality conditions expressed by a particular set of age specific mortality rates. It is sometimes referred to as "expectation of life at birth." The indicators provided give a rough picture of the human wellbeing across districts.

Maternal mortality rate: This refers to number of maternal deaths per 100,000 live births. A Maternal death is defined by WHO as "the death of a woman while pregnant or within 42 days of termination of pregnancy irrespective of the duration or site of the pregnancy, from any cause related to or aggravated by the pregnancy or its management but not from accidental causes." The number of maternal deaths are used as the numerator data together with other data from different courses to compute the maternal mortality rate.

It should however be pointed out that these figures were derived indirectly using the census data on mortality and the guidance of the medical statistics for inpatient data. 11% of the total female deaths in the year preceding the census was taken to be the maternal deaths of the same year, these deaths were then divided by total births in the same year weighted by averages of P/F ratios of age-groups 20-24 and 25-30 and multiplied by a 100,000.

The assumption here is that 11% of all female deaths are caused by maternal mortality. The rationale behind this methodology is that; the health statistics report of 1990/91 gives the number of maternal deaths of women between age 15-49 for 1990 as 42. If this figure, 42, is converted into percentage of the female deaths of that age-group, then 14.5% of the institutional deaths of females aged 15-49 is due to maternal causes. If the same is done for 1991 institutional deaths, the proportion of maternal deaths is 7.5%. To get a realistic adjustment factor both the 1990 and 1991 maternal and female deaths are averaged to alive at a factor of .11.

Hence; 1990 Maternal deaths (age 15-49) = percent dead = $42/289 = 14.5\%$
Female deaths (15-49)

While; 1991 Maternal deaths (age 15-49) = percent dead = $26/348 = 7.5$
Female deaths (15-49)

Average number of maternal deaths = 1990 deaths + 1991 deaths / 2 = $42+26=68$; $68/2=34$

Average number of female deaths = 1990 deaths + 1991 deaths / 2 = $289+348=637$; $637/2=318.5 = 24/318.5=10.7 = .11$ (adjustment factor)

To arrive at an estimate of maternal mortality rate the factor of 11% i.e. .11 is used with census information on births and deaths. Hence; Female deaths in the year preceding the census x .11 = maternal deaths.

Total births = total births in the year to the census weighted by average of P/F ratios of age-groups 20-24 and 25-30.

Estimated maternal mortality rate = Maternal deaths x 100,000
Total births

Men age at childbearing: This refers to average age at which a mortality-free cohort of women bear their children according to a set of age-specific fertility rates.

Teenage pregnancy rates: The indices used in deriving teenage pregnancy rates are fertility indices from the census. Parity³ for age group 15-19 was used together with an adjustment factor of 1.1 to arrive at an estimate

³Refers to number of children ever born alive by a particular woman (stillbirths are specifically excluded in demographic usage).

of teenage pregnancy. This factor was used to adjust for failed pregnancies since fertility indices do not account for pregnancies that do not result in birth. This then is assumed to account for pregnancy wastage; based on the assumption that "10-40% of all pregnancies end up in wastage⁴". In this case, a low variant of 10% is used. Therefore the rates are estimated and are not a direct measure from the census indices. Hence

$$\text{Teenage pregnancy rate} = \frac{\text{number of women age 15-19 who have had children} \times 1.1 \times 100}{\text{Total no. of women age 15-19}}$$

Total fertility rate: This refers to the average number of children that would be born per woman if all women lived to the end of their child-bearing years and bore children according to a given set of age-specific fertility rates. It is used to compute the consequence of childbearing at the rates currently observed.

Under five mortality rate: This is the probability of dying before attaining exact age 5 of children in the same cohort. It is therefore used as a cohort experience in a life table and expressed per 1000 live births.

Undernutrition prevalence: This is defined as the proportion of underfives who fall below the accepted weight-at-age by 80%. The severity progresses with the level of deviation from median weight. Nutrition data was acquired from the Nutrition Unit at the Family Health Division, Ministry of Health. They are not census data.

Unemployment: Unemployment levels were derived by computing the proportion of economically active population between the age of 15-64 years who are seeking work.

⁴Family planning methods and practices: Africa 1983.
